Fitting of Brompton grips

Brompton grips are designed to be used with an adhesive to produce a secure fit to the handlebar.

Remove the old grips and ensure the handlebar is free from grease or oil.

Run a bead of glue around the inside of the top of the grip as shown in fig HBG1.

Slide the grip onto the bar, turning it a couple of times to ensure the glue is fully spread around the bar.

The glue will take around 3 hours to grab in warm weather, longer if it is cold. We suggest leaving it overnight to ensure the bond is firm before riding the bike.
